For the purposes of these tests about 60 feet of standard 8-inch wrought pipe, coupled together, in order to make it smooth and regular, was suspended where it could not be subjected to currents of air. In order to get the steam as dry as possible it was sent through a separator on its way to the test pipe, and in the short connection between the separator and the pipe was placed a throttling calorimeter. The test pipe had an inclination of one foot in its entire length, which insured drainage of all the water of condensation to the lower end, at which point the receiver was connected, and into which the water gravitated as rapidly as formed. The water was measured...
